

Package ‘asa’

December 28, 2025

Title AI Search Agent for Large-Scale Research Automation

Version 0.1.0

Description Provides an LLM-powered research agent for performing AI search tasks at large scales. Uses a ReAct (Reasoning + Acting) agent pattern with web search capabilities via DuckDuckGo and Wikipedia. Implements DeepAgent-style memory folding for context management. The agent is built on 'LangGraph' and supports multiple LLM backends including 'OpenAI', 'Groq', and 'xAI'.

asa-package	<i>asa: AI Search Agent for Large-Scale Research Automation</i>
-------------	---

Description

The asa package provides an LLM-powered research agent for performing AI search tasks at large scales using web search capabilities.

The agent uses a ReAct (Reasoning + Acting) pattern implemented via LangGraph, with tools for searching DuckDuckGo and Wikipedia. It supports multiple LLM backends (OpenAI, Groq, xAI) and implements DeepAgent-style memory folding for managing long conversations.

Main Functions

- `build_backend`: Set up the Python conda environment
- `initialize_agent`: Initialize the search agent
- `run_task`: Run a structured task with the agent
- `run_task_batch`: Run multiple tasks in batch

Configuration

The package requires a Python environment with LangChain and related packages. Use `build_backend` to create this environment automatically.

For anonymous searching, the package can use Tor as a SOCKS5 proxy. Install Tor via `brew install tor` (macOS) and start it with `brew services start tor`.

<code>.asa_option</code>	<i>Get Package Option or Default</i>
--------------------------	--------------------------------------

Description

Returns the value of an asa package option, or the default if not set. Options can be set via `options(asa.option_name = value)`.

Usage

`.asa_option(name, default)`

Arguments

name	Option name (without "asa." prefix)
default	Default value if option not set

Value

Option value or default

.augment_prompt_temporal	<i>Augment Prompt with Temporal Context</i>
--------------------------	---

Description

Adds temporal date hints to the prompt when after/before dates are specified. This helps guide the agent to search for time-relevant information.

Usage

.augment_prompt_temporal(prompt, temporal)

Arguments

prompt	Original prompt
temporal	Temporal filtering list (may be NULL)

Value

Augmented prompt string

.build_trace	<i>Build Trace from Raw Response</i>
--------------	--------------------------------------

Description

Build Trace from Raw Response

Usage

.build_trace(raw_response)

<code>.close_http_clients</code>	<i>Close HTTP Clients</i>
----------------------------------	---------------------------

Description

Safely closes the synchronous httpx client to prevent resource leaks. This is called automatically by `reset_agent()` and when reinitializing.

Usage

```
.close_http_clients()
```

Details

Note: We no longer create or manage async clients from R (R-CRIT-001 fix). LangChain manages its own async client lifecycle internally.

Value

Invisibly returns NULL

<code>.create_agent</code>	<i>Create the LangGraph Agent</i>
----------------------------	-----------------------------------

Description

Create the LangGraph Agent

Usage

```
.create_agent(  
  llm,  
  tools,  
  use_memory_folding,  
  memory_threshold,  
  memory_keep_recent  
)
```

Arguments

<code>llm</code>	LLM instance
<code>tools</code>	List of tools
<code>use_memory_folding</code>	Whether to use memory folding
<code>memory_threshold</code>	Messages before folding
<code>memory_keep_recent</code>	Messages to keep

`.create_http_clients` *Create HTTP Client for API Calls*

Description

Creates a synchronous httpx client for LLM API calls. Note: We intentionally do NOT create an async client. LangChain/OpenAI SDK creates its own async client internally when needed (for async operations). This avoids R-CRIT-001 where async client cleanup was unreliable from R since `aclose()` requires an async context.

Usage

```
.create_http_clients(proxy, timeout)
```

Arguments

<code>proxy</code>	Proxy URL or NULL
<code>timeout</code>	Timeout in seconds

Value

A list with 'sync' client (async is NULL, letting LangChain manage it)

`.create_llm` *Create LLM Instance*

Description

Create LLM Instance

Usage

```
.create_llm(backend, model, clients, rate_limit)
```

Arguments

<code>backend</code>	Backend name
<code>model</code>	Model identifier
<code>clients</code>	HTTP clients (for OpenAI)
<code>rate_limit</code>	Requests per second

.create_research_config
Create Research Configuration

Description

Create Research Configuration

Usage

```
.create_research_config(  
    workers,  
    max_rounds,  
    budget,  
    stop_policy,  
    sources,  
    temporal = NULL  
)
```

.create_research_graph
Create Research Graph

Description

Create Research Graph

Usage

```
.create_research_graph(agent, config_dict)
```

.create_tools *Create Search Tools*

Description

Create Search Tools

Usage

```
.create_tools(proxy)
```

Arguments

proxy	Proxy URL or NULL
-------	-------------------

.extract_fields	<i>Extract Specific Fields from Response</i>
-----------------	--

Description

Extract Specific Fields from Response

Usage

.extract_fields(text, fields)

Arguments

text	Response text
fields	Character vector of field names to extract

.extract_json_from_trace	<i>Extract JSON from Agent Traces</i>
--------------------------	---------------------------------------

Description

Internal function to extract JSON data from raw agent traces.

Usage

.extract_json_from_trace(text)

Arguments

text	Raw trace text
------	----------------

Value

Parsed JSON data as a list, or NULL if no JSON found

.extract_json_object	<i>Extract JSON Object from Text</i>
----------------------	--------------------------------------

Description

Extract JSON Object from Text

Usage

.extract_json_object(text)

Arguments

text	Response text
------	---------------

.extract_response_text

Extract Response Text from Raw Response

Description

Extract Response Text from Raw Response

Usage

.extract_response_text(raw_response, backend)

.get_default_backend *Get Default Backend*

Description

Get Default Backend

Usage

.get_default_backend()

.get_default_conda_env
Get Default Conda Environment

Description

Get Default Conda Environment

Usage

.get_default_conda_env()

.get_default_model *Get Default Model*

Description

Get Default Model

Usage

.get_default_model()

<code>.get_default_workers</code>	<i>Get Default Workers</i>
-----------------------------------	----------------------------

Description

Get Default Workers

Usage

```
.get_default_workers()
```

<code>.get_extdata_path</code>	<i>Get External Data Path</i>
--------------------------------	-------------------------------

Description

Returns the path to the package's external data directory.

Usage

```
.get_extdata_path(filename = NULL)
```

Arguments

<code>filename</code>	Optional filename within extdata directory
-----------------------	--

Value

Character string with the path

<code>.get_local_ip</code>	<i>Get Local IP Address (Cross-Platform)</i>
----------------------------	--

Description

Returns the local IP address for use with Exo backend. Works on Windows, macOS, and Linux.

Usage

```
.get_local_ip()
```

Value

Character string with the local IP address, or "127.0.0.1" on failure.

<code>.get_python_path</code>	<i>Get Package Python Module Path</i>
-------------------------------	---------------------------------------

Description

Returns the path to the Python modules shipped with the package.

Usage

```
.get_python_path()
```

Value

Character string with the path to inst/python

<code>.handle_response_issues</code>	<i>Handle Response Issues (Rate Limiting, Timeouts)</i>
--------------------------------------	---

Description

Handle Response Issues (Rate Limiting, Timeouts)

Usage

```
.handle_response_issues(trace, verbose)
```

<code>.import_python_module</code>	<i>Import Python Module into asa_env</i>
------------------------------------	--

Description

Generic helper for importing Python modules from inst/python. Handles caching, path resolution, and error handling.

Usage

```
.import_python_module(module_name, env_name = module_name, required = TRUE)
```

Arguments

<code>module_name</code>	Name of the Python module (without .py)
<code>env_name</code>	Name in asa_env (defaults to module_name)
<code>required</code>	If TRUE, error on failure; if FALSE, return NULL

Value

The imported Python module (invisibly), or NULL on failure if not required

```
.import_python_packages
```

Import Required Python Packages

Description

Import Required Python Packages

Usage

```
.import_python_packages()
```

```
.import_research_modules
```

Import Research Python Modules

Description

Import Research Python Modules

Usage

```
.import_research_modules()
```

```
.invoke_memory_folding_agent
```

Invoke Memory Folding Agent

Description

Invoke Memory Folding Agent

Usage

```
.invoke_memory_folding_agent(python_agent, prompt, recursion_limit)
```

```
.invoke_standard_agent
```

Invoke Standard Agent

Description

Invoke Standard Agent

Usage

```
.invoke_standard_agent(python_agent, prompt, recursion_limit)
```

.is_initialized	<i>Check if ASA Agent is Initialized</i>
-----------------	--

Description

Check if ASA Agent is Initialized

Usage

.is_initialized()

Value

Logical indicating if the agent has been initialized

.normalize_schema	<i>Normalize Schema Input</i>
-------------------	-------------------------------

Description

Normalize Schema Input

Usage

.normalize_schema(schema, query, verbose)

.parse_json_response	<i>Parse JSON Response</i>
----------------------	----------------------------

Description

Parse JSON Response

Usage

.parse_json_response(response_text)

Arguments

response_text Response text from agent

.process_research_results	<i>Process Research Results</i>
---------------------------	---------------------------------

Description

Process Research Results

Usage

```
.process_research_results(result, schema_dict, include_provenance)
```

.resume_research	<i>Resume Research from Checkpoint</i>
------------------	--

Description

Resume Research from Checkpoint

Usage

```
.resume_research(checkpoint_file, verbose)
```

.run_agent	<i>Run the ASA Agent (Internal)</i>
------------	-------------------------------------

Description

Internal function that invokes the search agent with a prompt. Users should use [run_task](#) instead.

Usage

```
.run_agent(  
    prompt,  
    agent = NULL,  
    temporal = NULL,  
    recursion_limit = NULL,  
    verbose = FALSE  
)
```

Arguments

prompt	The prompt to send to the agent
agent	An asa_agent object
temporal	Named list for temporal filtering
recursion_limit	Maximum number of agent steps
verbose	Print status messages

Value

An object of class `asa_response`

<code>.run_research</code>	<i>Run Research (Non-Streaming)</i>
----------------------------	-------------------------------------

Description

Run Research (Non-Streaming)

Usage

```
.run_research(graph, query, schema_dict, config_dict)
```

<code>.run_research_with_progress</code>	<i>Run Research with Progress Updates</i>
--	---

Description

Run Research with Progress Updates

Usage

```
.run_research_with_progress(  
    graph,  
    query,  
    schema_dict,  
    config_dict,  
    checkpoint_file,  
    verbose  
)
```

<code>.save_checkpoint</code>	<i>Save Checkpoint</i>
-------------------------------	------------------------

Description

Save Checkpoint

Usage

```
.save_checkpoint(result, query, schema_dict, config_dict, checkpoint_file)
```

.stop_validation	Stop with Formatted Validation Error
------------------	--------------------------------------

Description

Creates a standardized error message with Got/Fix sections.

Usage

.stop_validation(param_name, requirement, actual = NULL, fix = NULL)

Arguments

param_name	Name of the parameter that failed validation
requirement	What the parameter should be
actual	What was actually received (optional, auto-formatted)
fix	Actionable fix suggestion

.validate_api_key	Validate API Key for Backend
-------------------	------------------------------

Description

Checks that the required API key environment variable is set for the specified backend. Throws an informative error if missing.

Usage

.validate_api_key(backend)

Arguments

backend	LLM backend name
---------	------------------

Value

Invisibly returns TRUE if valid

.validate_asa_agent	Validate S3 Constructor: asa_agent
---------------------	------------------------------------

Description

Validate S3 Constructor: asa_agent

Usage

.validate_asa_agent(python_agent, backend, model, config)

.validate_asa_response

Validate S3 Constructor: asa_response

Description

Validate S3 Constructor: asa_response

Usage

```
.validate_asa_response(  
    message,  
    status_code,  
    raw_response,  
    trace,  
    elapsed_time,  
    fold_count,  
    prompt  
)
```

.validate_asa_result

Validate S3 Constructor: asa_result

Description

Validate S3 Constructor: asa_result

Usage

```
.validate_asa_result(prompt, message, parsed, raw_output, elapsed_time, status)
```

.validate_build_backend

Validate build_backend() Parameters

Description

Validate build_backend() Parameters

Usage

```
.validate_build_backend(conda_env, conda, python_version)
```

.validate_build_prompt	<i>Validate build_prompt() Parameters</i>
------------------------	---

Description

Validate build_prompt() Parameters

Usage

.validate_build_prompt(template)

.validate_choice	<i>Validate Choice from Set</i>
------------------	---------------------------------

Description

Validate Choice from Set

Usage

.validate_choice(x, param_name, choices)

Arguments

x	Value to check
param_name	Name for error message
choices	Valid choices

.validate_conda_env	<i>Validate Conda Environment Name</i>
---------------------	--

Description

Validate Conda Environment Name

Usage

.validate_conda_env(x, param_name)

Arguments

x	Value to check
param_name	Name for error message

.validate_configure_search

Validate configure_search() Parameters

Description

Validate configure_search() Parameters

Usage

```
.validate_configure_search(  
    max_results,  
    timeout,  
    max_retries,  
    retry_delay,  
    backoff_multiplier,  
    captcha_backoff_base,  
    page_load_wait,  
    inter_search_delay,  
    conda_env  
)
```

.validate_consistency *Validate Logical Consistency Between Parameters*

Description

Validate Logical Consistency Between Parameters

Usage

```
.validate_consistency(condition, message, fix)
```

Arguments

condition	Condition that must be TRUE
message	Error message if condition is FALSE
fix	How to fix the issue

<code>.validate_dataframe</code>	<i>Validate Data Frame with Required Columns</i>
----------------------------------	--

Description

Validate Data Frame with Required Columns

Usage

```
.validate_dataframe(x, param_name, required_cols = NULL)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>required_cols</code>	Required column names (optional)

<code>.validate_initialize_agent</code>	<i>Validate initialize_agent() Parameters</i>
---	---

Description

Validate initialize_agent() Parameters

Usage

```
.validate_initialize_agent(
  backend,
  model,
  conda_env,
  proxy,
  use_memory_folding,
  memory_threshold,
  memory_keep_recent,
  rate_limit,
  timeout,
  verbose
)
```

<code>.validate_logical</code>	<i>Validate Boolean</i>
--------------------------------	-------------------------

Description

Validate Boolean

Usage

```
.validate_logical(x, param_name)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message

<code>.validate_positive</code>	<i>Validate Positive Number</i>
---------------------------------	---------------------------------

Description

Validate Positive Number

Usage

```
.validate_positive(x, param_name, allow_zero = FALSE, integer_only = FALSE)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>allow_zero</code>	Allow zero values (default: FALSE)
<code>integer_only</code>	Require integer values (default: FALSE)

<code>.validate_process_outputs</code>	<i>Validate process_outputs() Parameters</i>
--	--

Description

Validate process_outputs() Parameters

Usage

```
.validate_process_outputs(df, parallel, workers)
```

<code>.validate_proxy_url</code>	<i>Validate URL Format (SOCKS5 Proxy)</i>
----------------------------------	---

Description

Validate URL Format (SOCKS5 Proxy)

Usage

```
.validate_proxy_url(x, param_name)
```

Arguments

x	Value to check (NULL is valid = no proxy)
param_name	Name for error message

<code>.validate_range</code>	<i>Validate Range</i>
------------------------------	-----------------------

Description

Validate Range

Usage

```
.validate_range(x, param_name, min = NULL, max = NULL)
```

Arguments

x	Value to check (must already be validated as numeric)
param_name	Name for error message
min	Minimum allowed value (optional)
max	Maximum allowed value (optional)

<code>.validate_required</code>	<i>Validate Required Argument Presence</i>
---------------------------------	--

Description

Validate Required Argument Presence

Usage

```
.validate_required(x, param_name)
```

Arguments

x	Value to check
param_name	Name for error message

.validate_research_inputs *Validate Research Inputs*

Description

Validate Research Inputs

Usage

```
.validate_research_inputs(  
    query,  
    schema,  
    output,  
    workers,  
    max_rounds,  
    budget,  
    stop_policy,  
    sources,  
    checkpoint_dir,  
    resume_from  
)
```

.validate_run_agent *Validate run_agent() Parameters*

Description

Validate run_agent() Parameters

Usage

```
.validate_run_agent(prompt, agent, recursion_limit, verbose)
```

.validate_run_task *Validate run_task() Parameters*

Description

Validate run_task() Parameters

Usage

```
.validate_run_task(prompt, output_format, agent, verbose)
```

.validate_run_task_batch	<i>Validate run_task_batch() Parameters</i>
--------------------------	---

Description

Validate run_task_batch() Parameters

Usage

```
.validate_run_task_batch(  
    prompts,  
    output_format,  
    agent,  
    parallel,  
    workers,  
    progress  
)
```

.validate_s3_class	<i>Validate S3 Class</i>
--------------------	--------------------------

Description

Validate S3 Class

Usage

```
.validate_s3_class(x, param_name, expected_class)
```

Arguments

- x Value to check
- param_name Name for error message
- expected_class Expected S3 class name

<code>.validate_string</code>	<i>Validate Non-Empty String</i>
-------------------------------	----------------------------------

Description

Validate Non-Empty String

Usage

```
.validate_string(x, param_name, allow_empty = FALSE, allow_na = FALSE)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>allow_empty</code>	Allow empty strings (default: FALSE)
<code>allow_na</code>	Allow NA values (default: FALSE)

<code>.validate_string_vector</code>	<i>Validate Character Vector (Non-Empty)</i>
--------------------------------------	--

Description

Validate Character Vector (Non-Empty)

Usage

```
.validate_string_vector(x, param_name, min_length = 1L)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>min_length</code>	Minimum required length (default: 1)

<code>.validate_temporal</code>	<i>Validate Temporal Filtering Parameters</i>
---------------------------------	---

Description

Validates and normalizes temporal filtering parameters used by `run_task()` and `asa_enumerate()`. Returns a normalized list or NULL if input is NULL.

Usage

```
.validate_temporal(temporal, param_name = "temporal")
```

Arguments

<code>temporal</code>	Named list with temporal filtering options, or NULL
<code>param_name</code>	Name for error messages (default: "temporal")

Value

Normalized temporal list or NULL

<code>.with_temporal</code>	<i>Apply Temporal Filtering for a Single Operation</i>
-----------------------------	--

Description

Internal helper that applies temporal filtering, runs a function, and restores the original setting. Used by `run_task()` and `run_task_batch()`.

Usage

```
.with_temporal(temporal, fn)
```

Arguments

<code>temporal</code>	Named list with temporal options (time_filter, after, before)
<code>fn</code>	Function to run with temporal filtering applied

Value

Result of `fn()`

```
as.data.frame.asa_audit_result
```

Convert asa_audit_result to Data Frame

Description

Convert asa_audit_result to Data Frame

Usage

```
## S3 method for class 'asa_audit_result'  
as.data.frame(x, ...)
```

Arguments

x	An asa_audit_result object
...	Additional arguments (ignored)

Value

The audited data.frame with audit columns

```
as.data.frame.asa_enumerate_result
```

Convert asa_enumerate_result to Data Frame

Description

Convert asa_enumerate_result to Data Frame

Usage

```
## S3 method for class 'asa_enumerate_result'  
as.data.frame(x, ...)
```

Arguments

x	An asa_enumerate_result object
...	Additional arguments (ignored)

Value

The data data.frame from the result

as.data.frame.asa_result

Convert asa_result to Data Frame

Description

Convert asa_result to Data Frame

Usage

```
## S3 method for class 'asa_result'  
as.data.frame(x, ...)
```

Arguments

- x An asa_result object
- ... Additional arguments (ignored)

Value

A single-row data frame

asa_agent

Constructor for asa_agent Objects

Description

Creates an S3 object representing an initialized ASA search agent.

Usage

```
asa_agent(python_agent, backend, model, config)
```

Arguments

- python_agent The underlying Python agent object
- backend LLM backend name (e.g., "openai", "groq")
- model Model identifier
- config Agent configuration list

Value

An object of class asa_agent

ASA_API_ENDPOINTS	<i>Backend API Endpoints</i>
-------------------	------------------------------

Description

Backend API Endpoints

Usage

ASA_API_ENDPOINTS

Format

An object of class list of length 3.

ASA_API_KEY_ENV_VARS	<i>Environment Variables for API Keys</i>
----------------------	---

Description

Environment Variables for API Keys

Usage

ASA_API_KEY_ENV_VARS

Format

An object of class list of length 5.

asa_audit	<i>Audit Enumeration Results for Completeness and Quality</i>
-----------	---

Description

Validates enumeration results for completeness, consistency, and data quality using either Claude Code (CLI) or a LangGraph-based audit pipeline.

Usage

```
asa_audit(
  result,
  query = NULL,
  known_universe = NULL,
  checks = c("completeness", "consistency", "gaps", "anomalies"),
  backend = c("claude_code", "langgraph"),
  claude_model = "claude-sonnet-4-20250514",
  llm_model = "gpt-4.1-mini",
  interactive = FALSE,
  confidence_threshold = 0.8,
  timeout = 120,
  verbose = TRUE,
  agent = NULL
)
```

Arguments

result	An <code>asa_enumerate_result</code> object or a <code>data.frame</code> to audit
query	The original enumeration query (inferred from result if NULL)
known_universe	Optional vector of expected items for completeness check
checks	Character vector of checks to perform. Options: "completeness", "consistency", "gaps", "anomalies". Default runs all checks.
backend	Backend to use for auditing: "claude_code" (CLI) or "langgraph"
claude_model	Model to use with Claude Code backend
llm_model	Model to use with LangGraph backend
interactive	If TRUE and using <code>claude_code</code> backend, spawn an interactive Claude Code session instead of programmatic invocation
confidence_threshold	Flag items with confidence below this threshold
timeout	Timeout in seconds for the audit operation
verbose	Print progress messages
agent	Existing <code>asa_agent</code> for LangGraph backend (optional)

Details

The audit function adds three columns to the data:

- `_audit_flag`: "ok", "warning", or "suspect"
- `_audit_notes`: Explanation of any issues
- `_confidence_adjusted`: Revised confidence after audit

Audit Checks

completeness: Checks for missing items by comparing against `known_universe` (if provided) or using domain knowledge.

consistency: Validates data types, patterns, and value ranges.

gaps: Identifies systematic patterns of missing data (geographic, temporal, categorical gaps).

anomalies: Detects duplicates, outliers, and suspicious patterns.

Value

An `asa_audit_result` object containing:

<code>data</code>	Original data with audit columns added (<code>_audit_flag</code> , <code>_audit_notes</code>)
<code>audit_summary</code>	High-level summary of findings
<code>issues</code>	List of identified issues with severity and descriptions
<code>recommendations</code>	Suggested remediation queries
<code>completeness_score</code>	0-1 score for data completeness
<code>consistency_score</code>	0-1 score for data consistency

Examples

```
## Not run:
# Audit enumeration results with Claude Code
senators <- asa_enumerate(
  query = "Find all current US senators",
  schema = c(name = "character", state = "character", party = "character")
)
audit <- asa_audit(senators, backend = "claude_code")
print(audit)

# Audit with known universe for precise completeness check
audit <- asa_audit(senators, known_universe = state.abb)

# Interactive mode for complex audits
asa_audit(senators, backend = "claude_code", interactive = TRUE)

# Use LangGraph backend
audit <- asa_audit(senators, backend = "langgraph", agent = agent)

## End(Not run)
```

`asa_audit_result`
Constructor for `asa_audit_result` Objects

Description

Creates an S3 object representing the result of a data quality audit.

Usage

```
asa_audit_result(
  data,
  audit_summary,
  issues,
  recommendations,
  completeness_score,
```

```
consistency_score,  
backend_used,  
elapsed_time,  
query = NULL,  
checks = NULL  
)
```

Arguments

data	data.frame with original data plus audit columns (_audit_flag, _audit_notes)
audit_summary	Character string with high-level findings
issues	List of identified issues with severity and descriptions
recommendations	Character vector of suggested remediation queries
completeness_score	Numeric 0-1 score for data completeness
consistency_score	Numeric 0-1 score for data consistency
backend_used	Which backend performed the audit ("claude_code" or "langgraph")
elapsed_time	Execution time in seconds
query	The original query (if available)
checks	Character vector of checks that were performed

Value

An object of class `asa_audit_result`

asa_config	Create ASA Configuration Object
------------	---------------------------------

Description

Creates a configuration object that encapsulates all settings for ASA tasks. This provides a unified way to configure backend, model, search, temporal, and resource settings in a single object.

Usage

```
asa_config(  
  backend = NULL,  
  model = NULL,  
  conda_env = NULL,  
  proxy = NULL,  
  workers = NULL,  
  timeout = NULL,  
  rate_limit = NULL,  
  memory_folding = NULL,  
  memory_threshold = NULL,  
  memory_keep_recent = NULL,  
  temporal = NULL,  
  search = NULL  
)
```

Arguments

backend	LLM backend: "openai", "groq", "xai", "exo", "openrouter"
model	Model identifier (e.g., "gpt-4.1-mini")
conda_env	Conda environment name (default: "asa_env")
proxy	SOCKS5 proxy URL or NULL to disable
workers	Number of parallel workers for batch operations
timeout	Request timeout in seconds
rate_limit	Requests per second
memory_folding	Enable DeepAgent-style memory folding
memory_threshold	Messages before folding triggers
memory_keep_recent	Messages to preserve after folding
temporal	Temporal filtering options (use temporal_options())
search	Search configuration (use search_options())

Details

The configuration object can be passed to `run_task()`, `run_task_batch()`, `asa_enumerate()`, and other functions to provide consistent settings across operations.

Value

An object of class `asa_config`

See Also

[temporal_options](#), [search_options](#)

Examples

```
## Not run:
# Create configuration
config <- asa_config(
  backend = "openai",
  model = "gpt-4.1-mini",
  workers = 4,
  temporal = temporal_options(time_filter = "y")
)

# Use with run_task
result <- run_task(prompt, config = config)

## End(Not run)
```

ASA_DEFAULT_BACKEND	<i>Default Backend</i>
---------------------	------------------------

Description

Default Backend

Usage

ASA_DEFAULT_BACKEND

Format

An object of class character of length 1.

ASA_DEFAULT_BUDGET_QUERIES	<i>Default Budget: Queries</i>
----------------------------	--------------------------------

Description

Default Budget: Queries

Usage

ASA_DEFAULT_BUDGET_QUERIES

Format

An object of class integer of length 1.

ASA_DEFAULT_BUDGET_TIME	<i>Default Budget: Time (seconds)</i>
-------------------------	---------------------------------------

Description

Default Budget: Time (seconds)

Usage

ASA_DEFAULT_BUDGET_TIME

Format

An object of class integer of length 1.

ASA_DEFAULT_BUDGET_TOKENS

Default Budget: Tokens

Description

Default Budget: Tokens

Usage

ASA_DEFAULT_BUDGET_TOKENS

Format

An object of class integer of length 1.

ASA_DEFAULT_CONDA_ENV *Default Conda Environment*

Description

Default Conda Environment

Usage

ASA_DEFAULT_CONDA_ENV

Format

An object of class character of length 1.

ASA_DEFAULT_INTER_SEARCH_DELAY

Default Inter-Search Delay (seconds)

Description

Default Inter-Search Delay (seconds)

Usage

ASA_DEFAULT_INTER_SEARCH_DELAY

Format

An object of class numeric of length 1.

ASA_DEFAULT_MAX_RESULTS

Default Max Search Results

Description

Default Max Search Results

Usage

ASA_DEFAULT_MAX_RESULTS

Format

An object of class integer of length 1.

ASA_DEFAULT_MAX_RETRIES

Default Max Retries

Description

Default Max Retries

Usage

ASA_DEFAULT_MAX_RETRIES

Format

An object of class integer of length 1.

ASA_DEFAULT_MAX_ROUNDS

Default Max Rounds for Enumeration

Description

Default Max Rounds for Enumeration

Usage

ASA_DEFAULT_MAX_ROUNDS

Format

An object of class integer of length 1.

ASA_DEFAULT_MEMORY_FOLDING

Default Memory Folding Enabled

Description

Default Memory Folding Enabled

Usage

ASA_DEFAULT_MEMORY_FOLDING

Format

An object of class logical of length 1.

ASA_DEFAULT_MEMORY_KEEP_RECENT

Default Messages to Keep After Folding

Description

Default Messages to Keep After Folding

Usage

ASA_DEFAULT_MEMORY_KEEP_RECENT

Format

An object of class integer of length 1.

ASA_DEFAULT_MEMORY_THRESHOLD

Default Memory Threshold (messages before folding)

Description

Default Memory Threshold (messages before folding)

Usage

ASA_DEFAULT_MEMORY_THRESHOLD

Format

An object of class integer of length 1.

ASA_DEFAULT_MODEL	<i>Default Model</i>
-------------------	----------------------

Description

Default Model

Usage

ASA_DEFAULT_MODEL

Format

An object of class character of length 1.

ASA_DEFAULT_NOVELTY_MIN	<i>Default Minimum Novelty Rate</i>
-------------------------	-------------------------------------

Description

Default Minimum Novelty Rate

Usage

ASA_DEFAULT_NOVELTY_MIN

Format

An object of class numeric of length 1.

ASA_DEFAULT_NOVELTY_WINDOW	<i>Default Novelty Window</i>
----------------------------	-------------------------------

Description

Default Novelty Window

Usage

ASA_DEFAULT_NOVELTY_WINDOW

Format

An object of class integer of length 1.

ASA_DEFAULT_PAGE_LOAD_WAIT

Default Page Load Wait (seconds)

Description

Default Page Load Wait (seconds)

Usage

ASA_DEFAULT_PAGE_LOAD_WAIT

Format

An object of class numeric of length 1.

ASA_DEFAULT_PLATEAU_ROUNDS

Default Plateau Rounds for Stopping

Description

Default Plateau Rounds for Stopping

Usage

ASA_DEFAULT_PLATEAU_ROUNDS

Format

An object of class integer of length 1.

ASA_DEFAULT_PROXY

Default Proxy URL (Tor SOCKS5)

Description

Default Proxy URL (Tor SOCKS5)

Usage

ASA_DEFAULT_PROXY

Format

An object of class character of length 1.

ASA_DEFAULT_RATE_LIMIT

Default Rate Limit (requests per second)

Description

Default Rate Limit (requests per second)

Usage

ASA_DEFAULT_RATE_LIMIT

Format

An object of class numeric of length 1.

ASA_DEFAULT_TEMPERATURES

Default Temperatures by Backend

Description

Default Temperatures by Backend

Usage

ASA_DEFAULT_TEMPERATURES

Format

An object of class list of length 5.

ASA_DEFAULT_TIMEOUT

Default Request Timeout (seconds)

Description

Default Request Timeout (seconds)

Usage

ASA_DEFAULT_TIMEOUT

Format

An object of class integer of length 1.

ASA_DEFAULT_WIKI_CHARS	<i>Default Wikipedia Content Chars</i>
------------------------	--

Description

Default Wikipedia Content Chars

Usage

ASA_DEFAULT_WIKI_CHARS

Format

An object of class integer of length 1.

ASA_DEFAULT_WIKI_TOP_K	<i>Default Wikipedia Top K Results</i>
------------------------	--

Description

Default Wikipedia Top K Results

Usage

ASA_DEFAULT_WIKI_TOP_K

Format

An object of class integer of length 1.

ASA_DEFAULT_WORKERS	<i>Default Max Workers for Enumeration</i>
---------------------	--

Description

Default Max Workers for Enumeration

Usage

ASA_DEFAULT_WORKERS

Format

An object of class integer of length 1.

asa_enumerate	<i>Multi-Agent Research for Open-Ended Queries</i>
---------------	--

Description

Performs intelligent open-ended research tasks using multi-agent orchestration. Decomposes complex queries into sub-tasks, executes parallel searches, and aggregates results into structured output (data.frame, CSV, or JSON).

Usage

```
asa_enumerate(  
  query,  
  schema = NULL,  
  output = c("data.frame", "csv", "json"),  
  workers = NULL,  
  max_rounds = NULL,  
  budget = list(queries = 50L, tokens = 200000L, time_sec = 300L),  
  stop_policy = list(target_items = NULL, plateau_rounds = 2L, novelty_min = 0.05,  
    novelty_window = 20L),  
  sources = list(web = TRUE, wikipedia = TRUE, wikidata = TRUE),  
  temporal = NULL,  
  pagination = TRUE,  
  progress = TRUE,  
  include_provenance = FALSE,  
  checkpoint = TRUE,  
  checkpoint_dir = tempdir(),  
  resume_from = NULL,  
  agent = NULL,  
  backend = NULL,  
  model = NULL,  
  conda_env = NULL,  
  verbose = TRUE  
)
```

Arguments

query	Character string describing the research goal. Examples: "Find all current US senators with their state, party, and term end date"
schema	Named character vector defining the output schema. Names are column names, values are R types ("character", "numeric", "logical"). Use NULL or "auto" for LLM-proposed schema.
output	Output format: "data.frame" (default), "csv", or "json".
workers	Number of parallel search workers. Defaults to value from ASA_DEFAULT_WORKERS (typically 4).
max_rounds	Maximum research iterations. Defaults to value from ASA_DEFAULT_MAX_ROUNDS (typically 8).
budget	Named list with resource limits: <ul style="list-style-type: none">• queries: Maximum search queries (default: 50)

	<ul style="list-style-type: none"> • <code>tokens</code>: Maximum LLM tokens (default: 200000) • <code>time_sec</code>: Maximum execution time in seconds (default: 300)
<code>stop_policy</code>	Named list with stopping criteria: <ul style="list-style-type: none"> • <code>target_items</code>: Stop when this many items found (NULL = unknown) • <code>plateau_rounds</code>: Stop after N rounds with no new items (default: 2) • <code>novelty_min</code>: Minimum new items ratio per round (default: 0.05) • <code>novelty_window</code>: Window size for novelty calculation (default: 20)
<code>sources</code>	Named list controlling which sources to use: <ul style="list-style-type: none"> • <code>web</code>: Use DuckDuckGo web search (default: TRUE) • <code>wikipedia</code>: Use Wikipedia (default: TRUE) • <code>wikidata</code>: Use Wikidata SPARQL for authoritative enumerations (default: TRUE)
<code>temporal</code>	Named list for temporal filtering: <ul style="list-style-type: none"> • <code>after</code>: ISO 8601 date string (e.g., "2020-01-01") - results after this date • <code>before</code>: ISO 8601 date string (e.g., "2024-01-01") - results before this date • <code>time_filter</code>: DuckDuckGo time filter ("d", "w", "m", "y") for day/week/month/year • <code>strictness</code>: "best_effort" (default) or "strict" (verifies dates via metadata) • <code>use_wayback</code>: Use Wayback Machine for strict pre-date guarantees (default: FALSE)
<code>pagination</code>	Enable pagination for large result sets (default: TRUE).
<code>progress</code>	Show progress bar and status updates (default: TRUE).
<code>include_provenance</code>	Include source URLs and confidence per row (default: FALSE).
<code>checkpoint</code>	Enable auto-save after each round (default: TRUE).
<code>checkpoint_dir</code>	Directory for checkpoint files (default: <code>tempdir()</code>).
<code>resume_from</code>	Path to checkpoint file to resume from (default: NULL).
<code>agent</code>	An initialized <code>asa_agent</code> object. If NULL, uses the current agent or creates a new one with specified backend/model.
<code>backend</code>	LLM backend if creating new agent: "openai", "groq", "xai", "openrouter".
<code>model</code>	Model identifier if creating new agent.
<code>conda_env</code>	Conda environment name (default: "asa_env").
<code>verbose</code>	Print status messages (default: TRUE).

Details

The function uses a multi-agent architecture:

1. **Planner**: Decomposes query into facets and identifies authoritative sources
2. **Dispatcher**: Spawns parallel workers for each facet
3. **Workers**: Execute searches using DDG, Wikipedia, and Wikidata
4. **Extractor**: Normalizes results to match schema
5. **Deduper**: Removes duplicates using hash + fuzzy matching
6. **Stopper**: Evaluates stopping criteria (novelty, budget, saturation)

For known entity types (US senators, countries, Fortune 500), Wikidata provides authoritative enumerations with complete, verified data.

Value

An object of class `asa_enumerate_result` containing:

- `data`: `data.frame` with results matching the schema
- `status`: "complete", "partial", or "failed"
- `stop_reason`: Why the search stopped
- `metrics`: List with rounds, queries_used, novelty_curve, coverage
- `provenance`: If `include_provenance=TRUE`, source info per row
- `checkpoint_file`: Path to checkpoint if saved

Checkpointing

With `checkpoint=TRUE`, state is saved after each round. If interrupted, use `resume_from` to continue from the last checkpoint:

```
result <- asa_enumerate(query, resume_from = "/path/to/checkpoint.rds")
```

Schema

The schema defines expected output columns:

```
schema = c(name = "character", state = "character", party = "character")
```

With `schema = "auto"`, the planner agent proposes a schema based on the query.

See Also

[run_task](#), [initialize_agent](#)

Examples

```
## Not run:
# Find all US senators
senators <- asa_enumerate(
  query = "Find all current US senators with state, party, and term end date",
  schema = c(name = "character", state = "character",
             party = "character", term_end = "character"),
  stop_policy = list(target_items = 100),
  include_provenance = TRUE
)
head(senators$data)

# Find countries with auto schema
countries <- asa_enumerate(
  query = "Find all countries with their capitals and populations",
  schema = "auto",
  output = "csv"
)

# Resume from checkpoint
result <- asa_enumerate(
  query = "Find Fortune 500 CEOs",
  resume_from = "/tmp/asa_enumerate_abc123.rds"
)
```

```
# Temporal filtering: results from specific date range
companies_2020s <- asa_enumerate(
  query = "Find tech companies founded recently",
  temporal = list(
    after = "2020-01-01",
    before = "2024-01-01",
    strictness = "best_effort"
  )
)

# Temporal filtering: past year with DuckDuckGo time filter
recent_news <- asa_enumerate(
  query = "Find AI research breakthroughs",
  temporal = list(
    time_filter = "y" # past year
  )
)

# Strict temporal filtering with Wayback Machine
historical <- asa_enumerate(
  query = "Find Fortune 500 companies",
  temporal = list(
    before = "2015-01-01",
    strictness = "strict",
    use_wayback = TRUE
  )
)

## End(Not run)
```

asa_enumerate_result *Constructor for asa_enumerate_result Objects*

Description

Creates an S3 object representing the result of an enumeration task.

Usage

```
asa_enumerate_result(
  data,
  status,
  stop_reason,
  metrics,
  provenance = NULL,
  plan = NULL,
  checkpoint_file = NULL,
  query = NULL,
  schema = NULL
)
```

Arguments

data	data.frame containing the enumeration results
status	Result status: "complete", "partial", or "failed"
stop_reason	Why the enumeration stopped (e.g., "target_reached", "novelty_plateau")
metrics	List with execution metrics (rounds, queries_used, etc.)
provenance	Optional data.frame with source information per row
plan	The enumeration plan from the planner agent
checkpoint_file	Path to saved checkpoint file
query	The original enumeration query
schema	The schema used for extraction

Value

An object of class `asa_enumerate_result`

ASA_OUTPUT_FORMATS	<i>Valid Output Formats</i>
--------------------	-----------------------------

Description

Valid Output Formats

Usage

ASA_OUTPUT_FORMATS

Format

An object of class `character` of length 3.

ASA_PRINT_WIDTH	<i>Print Width for Output</i>
-----------------	-------------------------------

Description

Print Width for Output

Usage

ASA_PRINT_WIDTH

Format

An object of class `integer` of length 1.

ASA_RATE_LIMIT_WAIT	<i>Rate Limit Wait Time (seconds)</i>
---------------------	---------------------------------------

Description

Rate Limit Wait Time (seconds)

Usage

ASA_RATE_LIMIT_WAIT

Format

An object of class integer of length 1.

ASA_RECURSION_LIMIT_FOLDING	<i>Recursion Limit with Memory Folding</i>
-----------------------------	--

Description

Recursion Limit with Memory Folding

Usage

ASA_RECURSION_LIMIT_FOLDING

Format

An object of class integer of length 1.

ASA_RECURSION_LIMIT_STANDARD	<i>Recursion Limit without Memory Folding</i>
------------------------------	---

Description

Recursion Limit without Memory Folding

Usage

ASA_RECURSION_LIMIT_STANDARD

Format

An object of class integer of length 1.

asa_response	<i>Constructor for asa_response Objects</i>
--------------	---

Description

Creates an S3 object representing an agent response.

Usage

```
asa_response(  
  message,  
  status_code,  
  raw_response,  
  trace,  
  elapsed_time,  
  fold_count,  
  prompt  
)
```

Arguments

message	The final response text
status_code	Status code (200 = success, 100 = error)
raw_response	The full Python response object
trace	Full text trace of agent execution
elapsed_time	Execution time in minutes
fold_count	Number of memory folds performed
prompt	The original prompt

Value

An object of class asa_response

asa_result	<i>Constructor for asa_result Objects</i>
------------	---

Description

Creates an S3 object representing the result of a research task.

Usage

```
asa_result(prompt, message, parsed, raw_output, elapsed_time, status)
```

Arguments

prompt	The original prompt
message	The agent’s response text
parsed	Parsed output (list or NULL)
raw_output	Full agent trace
elapsed_time	Execution time in minutes
status	Status ("success" or "error")

Value

An object of class asa_result

ASA_STATUS_ERROR	Status Code: Error
------------------	--------------------

Description

Status Code: Error

Usage

ASA_STATUS_ERROR

Format

An object of class integer of length 1.

ASA_STATUS_SUCCESS	Status Code: Success
--------------------	----------------------

Description

Status Code: Success

Usage

ASA_STATUS_SUCCESS

Format

An object of class integer of length 1.

ASA_SUPPORTED_BACKENDS	<i>Supported Backends</i>
------------------------	---------------------------

Description

Supported Backends

Usage

ASA_SUPPORTED_BACKENDS

Format

An object of class character of length 5.

ASA_TEMPORAL_STRICTNESS	<i>Valid Temporal Strictness Levels</i>
-------------------------	---

Description

Valid Temporal Strictness Levels

Usage

ASA_TEMPORAL_STRICTNESS

Format

An object of class character of length 2.

ASA_TIME_FILTERS	<i>Valid Temporal Time Filters</i>
------------------	------------------------------------

Description

Valid Temporal Time Filters

Usage

ASA_TIME_FILTERS

Format

An object of class character of length 4.

ASA_TRUNCATE_LENGTH	<i>String Truncation Length</i>
---------------------	---------------------------------

Description

String Truncation Length

Usage

ASA_TRUNCATE_LENGTH

Format

An object of class integer of length 1.

build_backend	<i>Build the Python Backend Environment</i>
---------------	---

Description

Creates a conda environment with all required Python dependencies for the asa search agent, including LangChain, LangGraph, and search tools.

Usage

build_backend(conda_env = "asa_env", conda = "auto", python_version = "3.13")

Arguments

- | | |
|----------------|--|
| conda_env | Name of the conda environment (default: "asa_env") |
| conda | Path to conda executable (default: "auto") |
| python_version | Python version to use (default: "3.13") |

Details

This function creates a new conda environment and installs the following Python packages:

- langchain_groq, langchain_community, langchain_openai
- langgraph
- ddgs (DuckDuckGo search)
- selenium, primp (browser automation)
- beautifulsoup4, requests
- fake_headers, httpx
- pysocks, socksio (proxy support)

Value

Invisibly returns NULL; called for side effects.

Examples

```
## Not run:
# Create the default environment
build_backend()

# Create with a custom name
build_backend(conda_env = "my_asa_env")

## End(Not run)
```

build_prompt	<i>Build a Task Prompt from Template</i>
--------------	--

Description

Creates a formatted prompt by substituting variables into a template.

Usage

```
build_prompt(template, ...)
```

Arguments

template	A character string with placeholders in the form {variable_name}
...	Named arguments to substitute into the template

Value

A formatted prompt string

Examples

```
## Not run:
prompt <- build_prompt(
  template = "Find information about {{name}} in {{country}} during {{year}}",
  name = "Marie Curie",
  country = "France",
  year = 1903
)

## End(Not run)
```

check_backend	<i>Check Python Environment Availability</i>
---------------	--

Description

Checks if the required Python environment and packages are available.

Usage

```
check_backend(conda_env = "asa_env")
```

Arguments

conda_env	Name of the conda environment to check
-----------	--

Value

A list with components:

- available: Logical, TRUE if environment is ready
- conda_env: Name of the environment checked
- python_version: Python version if available
- missing_packages: Character vector of missing packages (if any)

Examples

```
## Not run:  
status <- check_backend()  
if (!status$available) {  
  build_backend()  
}  
  
## End(Not run)
```

clean_whitespace	<i>Clean Whitespace</i>
------------------	-------------------------

Description

Normalizes whitespace in a string by collapsing multiple spaces and trimming leading/trailing whitespace.

Usage

```
clean_whitespace(x)
```

Arguments

x	Character string
---	------------------

Value

Cleaned string

configure_search	<i>Configure Python Search Parameters</i>
------------------	---

Description

Sets global configuration values for the Python search module. These values control timeouts, retry behavior, and result limits.

Usage

```
configure_search(  
    max_results = NULL,  
    timeout = NULL,  
    max_retries = NULL,  
    retry_delay = NULL,  
    backoff_multiplier = NULL,  
    captcha_backoff_base = NULL,  
    page_load_wait = NULL,  
    inter_search_delay = NULL,  
    conda_env = "asa_env"  
)
```

Arguments

- max_results Maximum number of search results to return (default: 10)
- timeout HTTP request timeout in seconds (default: 15)
- max_retries Maximum retry attempts on failure (default: 3)
- retry_delay Initial delay between retries in seconds (default: 2)
- backoff_multiplier Multiplier for exponential backoff (default: 1.5)
- captcha_backoff_base Base multiplier for CAPTCHA backoff (default: 3)
- page_load_wait Wait time after page load in seconds (default: 2)
- inter_search_delay Delay between consecutive searches in seconds (default: 0.5)
- conda_env Name of the conda environment (default: "asa_env")

Value

Invisibly returns a list with the current configuration

Examples

```
## Not run:
# Increase timeout for slow connections
configure_search(timeout = 30, max_retries = 5)

# Get more results
configure_search(max_results = 20)

# Add delay between searches to avoid rate limiting
configure_search(inter_search_delay = 2.0)

## End(Not run)
```

`configure_search_logging`*Configure Python Search Logging Level*

Description

Sets the logging level for the Python search module. This controls how much diagnostic output is produced during web searches.

Usage

```
configure_search_logging(level = "WARNING", conda_env = "asa_env")
```

Arguments

<code>level</code>	Log level: "DEBUG", "INFO", "WARNING" (default), "ERROR", or "CRITICAL"
<code>conda_env</code>	Name of the conda environment (default: "asa_env")

Details

Log levels from most to least verbose:

- **DEBUG**: Detailed diagnostic information for debugging
- **INFO**: General operational information
- **WARNING**: Indicates something unexpected but not an error (default)
- **ERROR**: Serious problems that prevented an operation
- **CRITICAL**: Very serious errors

Value

Invisibly returns the current logging level

Examples

```
## Not run:
# Enable verbose debugging output
configure_search_logging("DEBUG")

# Run a search (will show detailed logs)
result <- run_task("What is the population of Tokyo?", agent = agent)

# Disable verbose output
configure_search_logging("WARNING")

## End(Not run)
```

configure_temporal	<i>Configure Temporal Filtering for Search</i>
--------------------	--

Description

Sets or clears temporal filtering on the DuckDuckGo search tool. This affects all subsequent searches until changed or cleared.

Usage

```
configure_temporal(time_filter = NULL)
```

Arguments

time_filter	DuckDuckGo time filter: "d" (day), "w" (week), "m" (month), "y" (year), or NULL/NA/"none" to clear
-------------	--

Details

This function modifies the search tool's time parameter, which is passed to DuckDuckGo as the df parameter. The filter restricts results to content indexed within the specified time period.

Note: This only affects DuckDuckGo searches. For Wikidata queries with temporal filtering, use `asa_enumerate()` with its temporal parameter.

Value

Invisibly returns the previous time filter setting

Time Filter Values

- "d": Past 24 hours (day)
- "w": Past 7 days (week)
- "m": Past 30 days (month)
- "y": Past 365 days (year)
- NULL, NA, or "none": No time restriction (default)

See Also

[run_task](#), [asa_enumerate](#)

Examples

```
## Not run:
# Restrict to past year
configure_temporal("y")
result <- run_task("Find recent AI breakthroughs", agent = agent)

# Clear temporal filter
configure_temporal(NULL)

# Past week only
configure_temporal("w")

## End(Not run)
```

decode_html	<i>Decode HTML Entities</i>
-------------	-----------------------------

Description

Converts HTML entities to their character equivalents.

Usage

```
decode_html(x)
```

Arguments

x Character string with HTML entities

Value

Decoded string

extract_agent_results	<i>Extract Structured Data from Agent Traces</i>
-----------------------	--

Description

Parses raw agent output to extract search snippets, Wikipedia content, URLs, JSON data, and search tier information. This is the main function for post-processing agent traces.

Usage

```
extract_agent_results(raw_output)
```

Arguments

raw_output	Raw output string from agent invocation (the trace field from an asa_response object)
------------	---

Value

A list with components:

- search_snippets: Character vector of search result content
- search_urls: Character vector of URLs from search results
- wikipedia_snippets: Character vector of Wikipedia content
- json_data: Extracted JSON data as a list (if present)
- search_tiers: Character vector of unique search tiers used (e.g., "primp", "selenium", "ddgs", "requests")

Examples

```
## Not run:
response <- run_agent("Who is the president of France?", agent)
extracted <- extract_agent_results(response$trace)
print(extracted$search_snippets)
print(extracted$search_tiers) # Shows which search tier was used

## End(Not run)
```

extract_search_snippets

Extract Search Snippets by Source Number

Description

Extracts content from Search tool messages in the agent trace.

Usage

```
extract_search_snippets(text)
```

Arguments

text	Raw agent trace text
------	----------------------

Value

Character vector of search snippets, ordered by source number

Examples

```
## Not run:
snippets <- extract_search_snippets(response$trace)

## End(Not run)
```

extract_search_tiers	<i>Extract Search Tier Information</i>
----------------------	--

Description

Extracts which search tier was used from the agent trace. The search module uses a multi-tier fallback system:

- primp: Fast HTTP client with browser impersonation (Tier 0)
- selenium: Headless browser for JS-rendered content (Tier 1)
- ddgs: Standard DDGS Python library (Tier 2)
- requests: Raw POST to DuckDuckGo HTML endpoint (Tier 3)

Usage

```
extract_search_tiers(text)
```

Arguments

text	Raw agent trace text
------	----------------------

Value

Character vector of unique tier names encountered (e.g., "primp", "selenium", "ddgs", "requests")

Examples

```
## Not run:  
tiers <- extract_search_tiers(response$trace)  
print(tiers) # e.g., "primp"  
  
## End(Not run)
```

extract_urls	<i>Extract URLs by Source Number</i>
--------------	--------------------------------------

Description

Extracts URLs from Search tool messages in the agent trace.

Usage

```
extract_urls(text)
```

Arguments

text	Raw agent trace text
------	----------------------

Value

Character vector of URLs, ordered by source number

Examples

```
## Not run:
urls <- extract_urls(response$trace)

## End(Not run)
```

extract_wikipedia_content	
	<i>Extract Wikipedia Content</i>

Description

Extracts content from Wikipedia tool messages in the agent trace.

Usage

```
extract_wikipedia_content(text)
```

Arguments

text	Raw agent trace text
------	----------------------

Value

Character vector of Wikipedia snippets

Examples

```
## Not run:
wiki <- extract_wikipedia_content(response$trace)

## End(Not run)
```

format_duration	<i>Format Time Duration</i>
-----------------	-----------------------------

Description

Formats a numeric duration (in minutes) as a human-readable string.

Usage

```
format_duration(minutes)
```

Arguments

minutes Numeric duration in minutes

Value

Formatted string

get_agent	<i>Get the Current Agent</i>
-----------	------------------------------

Description

Returns the currently initialized agent, or NULL if not initialized.

Usage

```
get_agent()
```

Value

An asa_agent object or NULL

Examples

```
## Not run:
agent <- get_agent()
if (is.null(agent)) {
  agent <- initialize_agent()
}

## End(Not run)
```

get_tor_ip	<i>Get External IP via Tor</i>
------------	--------------------------------

Description

Retrieves the external IP address as seen through Tor proxy.

Usage

```
get_tor_ip(proxy = "socks5h://127.0.0.1:9050")
```

Arguments

proxy Tor proxy URL

Value

IP address string or NA on failure

Examples

```
## Not run:
ip <- get_tor_ip()
message("Current Tor IP: ", ip)

## End(Not run)
```

initialize_agent	<i>Initialize the ASA Search Agent</i>
------------------	--

Description

Initializes the Python environment and creates the LangGraph agent with search tools (Wikipedia, DuckDuckGo). The agent can use multiple LLM backends and supports DeepAgent-style memory folding.

Usage

```
initialize_agent(
  backend = "openai",
  model = "gpt-4.1-mini",
  conda_env = "asa_env",
  proxy = "socks5h://127.0.0.1:9050",
  use_memory_folding = TRUE,
  memory_threshold = 4L,
  memory_keep_recent = 2L,
  rate_limit = 0.2,
  timeout = 120L,
  verbose = TRUE
)
```

Arguments

backend	LLM backend to use. One of: "openai", "groq", "xai", "exo", "openrouter"
model	Model identifier (e.g., "gpt-4.1-mini", "llama-3.3-70b-versatile")
conda_env	Name of the conda environment with Python dependencies
proxy	SOCKS5 proxy URL for Tor (default: "socks5h://127.0.0.1:9050"). Set to NULL to disable proxy.
use_memory_folding	Enable DeepAgent-style memory compression (default: TRUE)
memory_threshold	Number of messages before folding triggers (default: 4)
memory_keep_recent	Number of recent messages to preserve after folding (default: 2)
rate_limit	Requests per second for rate limiting (default: 0.2)
timeout	Request timeout in seconds (default: 120)
verbose	Print status messages (default: TRUE)

Details

The agent is created with two tools:

- Wikipedia: For looking up encyclopedic information
- DuckDuckGo Search: For web searches with a 4-tier fallback system (PRIMP -> Selenium -> DDGS library -> raw requests)

Memory folding (enabled by default) compresses older messages into a summary to manage context length in long conversations, following the DeepAgent paper.

Value

An object of class `asa_agent` containing the initialized agent and configuration.

API Keys

The following environment variables should be set based on your backend:

- OpenAI: `OPENAI_API_KEY`
- Groq: `GROQ_API_KEY`
- xAI: `XAI_API_KEY`
- OpenRouter: `OPENROUTER_API_KEY`

OpenRouter Models

When using the "openrouter" backend, model names must be in provider/model-name format. Examples:

- "openai/gpt-4o"
- "anthropic/claude-3-sonnet"
- "google/gemma-2-9b-it:free"
- "meta-llama/llama-3-70b-instruct"

See <https://openrouter.ai/models> for available models.

See Also

[run_task](#), [run_task_batch](#)

Examples

```
## Not run:
# Initialize with OpenAI
agent <- initialize_agent(
  backend = "openai",
  model = "gpt-4.1-mini"
)

# Initialize with Groq and custom settings
agent <- initialize_agent(
  backend = "groq",
  model = "llama-3.3-70b-versatile",
  use_memory_folding = FALSE,
  proxy = NULL # No Tor proxy
```

```
)

# Initialize with OpenRouter (access to 100+ models)
agent <- initialize_agent(
  backend = "openrouter",
  model = "anthropic/claude-3-sonnet" # Note: provider/model format
)

## End(Not run)
```

is_tor_running	<i>Check if Tor is Running</i>
----------------	--------------------------------

Description

Checks if Tor is running and accessible on the default port.

Usage

```
is_tor_running(port = 9050L)
```

Arguments

port Port number (default: 9050)

Value

Logical indicating if Tor appears to be running

Examples

```
## Not run:
if (!is_tor_running()) {
  message("Start Tor with: brew services start tor")
}

## End(Not run)
```

json_escape	<i>Clean Text for JSON Output</i>
-------------	-----------------------------------

Description

Escapes special characters in text for safe inclusion in JSON strings.

Usage

```
json_escape(x)
```

Arguments

x Character string to escape

Value

Escaped string

print.asa_agent	<i>Print Method for asa_agent Objects</i>
-----------------	---

Description

Print Method for asa_agent Objects

Usage

```
## S3 method for class 'asa_agent'  
print(x, ...)
```

Arguments

x An asa_agent object
... Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_audit_result	<i>Print Method for asa_audit_result Objects</i>
------------------------	--

Description

Print Method for asa_audit_result Objects

Usage

```
## S3 method for class 'asa_audit_result'  
print(x, n = 6, ...)
```

Arguments

x An asa_audit_result object
n Number of data rows to preview (default: 6)
... Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_config	<i>Print Method for asa_config Objects</i>
------------------	--

Description

Print Method for asa_config Objects

Usage

```
## S3 method for class 'asa_config'  
print(x, ...)
```

Arguments

x	An asa_config object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_enumerate_result	<i>Print Method for asa_enumerate_result Objects</i>
----------------------------	--

Description

Print Method for asa_enumerate_result Objects

Usage

```
## S3 method for class 'asa_enumerate_result'  
print(x, n = 6, ...)
```

Arguments

x	An asa_enumerate_result object
n	Number of data rows to preview (default: 6)
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_response	<i>Print Method for asa_response Objects</i>
--------------------	--

Description

Print Method for asa_response Objects

Usage

```
## S3 method for class 'asa_response'  
print(x, ...)
```

Arguments

x	An asa_response object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_result	<i>Print Method for asa_result Objects</i>
------------------	--

Description

Print Method for asa_result Objects

Usage

```
## S3 method for class 'asa_result'  
print(x, ...)
```

Arguments

x	An asa_result object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_search	<i>Print Method for asa_search Objects</i>
------------------	--

Description

Print Method for asa_search Objects

Usage

```
## S3 method for class 'asa_search'  
print(x, ...)
```

Arguments

x	An asa_search object
...	Additional arguments (ignored)

print.asa_temporal	<i>Print Method for asa_temporal Objects</i>
--------------------	--

Description

Print Method for asa_temporal Objects

Usage

```
## S3 method for class 'asa_temporal'  
print(x, ...)
```

Arguments

x	An asa_temporal object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print2	<i>Print Utility</i>
--------	----------------------

Description

Wrapper around cat for consistent output formatting.

Usage

```
print2(...)
```

Arguments

... Arguments passed to cat

process_outputs	<i>Process Multiple Agent Outputs</i>
-----------------	---------------------------------------

Description

Processes a data frame of raw agent outputs, extracting structured data.

Usage

```
process_outputs(df, parallel = FALSE, workers = 10L)
```

Arguments

df	Data frame with a 'raw_output' column containing agent traces
parallel	Use parallel processing
workers	Number of workers

Value

The input data frame with additional extracted columns: search_count, wiki_count, and any JSON fields found

reset_agent	<i>Reset the Agent</i>
-------------	------------------------

Description

Clears the initialized agent state, forcing reinitialization on next use. Also closes any open HTTP clients to prevent resource leaks.

Usage

```
reset_agent()
```

Value

Invisibly returns NULL

rotate_tor_circuit	<i>Rotate Tor Circuit</i>
--------------------	---------------------------

Description

Requests a new Tor circuit by restarting the Tor service.

Usage

```
rotate_tor_circuit(method = c("brew", "systemctl", "signal"), wait = 12L)
```

Arguments

method	Method to restart: "brew" (macOS), "systemctl" (Linux), or "signal"
wait	Seconds to wait for new circuit (default: 12)

Value

Invisibly returns NULL

Examples

```
## Not run:  
rotate_tor_circuit()  
  
## End(Not run)
```

run_task	<i>Run a Structured Task with the Agent</i>
----------	---

Description

Executes a research task using the AI search agent with a structured prompt and returns parsed results. This is the primary function for running agent tasks.

Usage

```
run_task(  
    prompt,  
    output_format = "text",  
    temporal = NULL,  
    config = NULL,  
    agent = NULL,  
    verbose = FALSE  
)
```

Arguments

prompt	The task prompt or question for the agent to research
output_format	Expected output format. One of: <ul style="list-style-type: none">• "text": Returns response text (default)• "json": Parse response as JSON• "raw": Include full trace in result for debugging• Character vector: Extract specific fields from response
temporal	Named list or asa_temporal object for temporal filtering: <ul style="list-style-type: none">• time_filter: DuckDuckGo time filter - "d" (day), "w" (week), "m" (month), "y" (year)• after: ISO 8601 date (e.g., "2020-01-01") - hint for results after this date (added to prompt context)• before: ISO 8601 date (e.g., "2024-01-01") - hint for results before this date (added to prompt context)
config	An asa_config object for unified configuration, or NULL to use defaults
agent	An asa_agent object from initialize_agent , or NULL to use the currently initialized agent
verbose	Print progress messages (default: FALSE)

Details

This function provides the primary interface for running research tasks. For simple text responses, use output_format = "text". For structured outputs, use output_format = "json" or specify field names to extract. For debugging and full trace access, use output_format = "raw".

When temporal filtering is specified, the search tool's time filter is temporarily set for this task and restored afterward. Date hints (after/before) are appended to the prompt to guide the agent's search behavior.

Value

An `asa_result` object with:

- `prompt`: The original prompt
- `message`: The agent's response text
- `parsed`: Parsed output (list for JSON/field extraction, NULL for text/raw)
- `raw_output`: Full agent trace (always included, verbose for "raw" format)
- `elapsed_time`: Execution time in minutes
- `status`: "success" or "error"
- `trace`: Full execution trace (for "raw" output_format)
- `fold_count`: Number of memory folds (for "raw" output_format)

Examples

```
## Not run:
# Initialize agent first
agent <- initialize_agent(backend = "openai", model = "gpt-4.1-mini")

# Simple text query
result <- run_task(
  prompt = "What is the capital of France?",
  output_format = "text",
  agent = agent
)
print(result$message)

# JSON structured output
result <- run_task(
  prompt = "Find information about Albert Einstein and return JSON with
           fields: birth_year, death_year, nationality, field_of_study",
  output_format = "json",
  agent = agent
)
print(result$parsed)

# Raw output for debugging (includes full trace in asa_result)
result <- run_task(
  prompt = "Search for information",
  output_format = "raw",
  agent = agent
)
cat(result$trace) # View full agent trace

# With temporal filtering (past year only)
result <- run_task(
  prompt = "Find recent AI research breakthroughs",
  temporal = temporal_options(time_filter = "y"),
  agent = agent
)
```

```

# With date range hint
result <- run_task(
  prompt = "Find tech companies founded recently",
  temporal = list(
    time_filter = "y",
    after = "2020-01-01",
    before = "2024-01-01"
  ),
  agent = agent
)

# Using asa_config for unified configuration
config <- asa_config(
  backend = "openai",
  model = "gpt-4.1-mini",
  temporal = temporal_options(time_filter = "y")
)
result <- run_task(prompt, config = config)

## End(Not run)

```

run_task_batch

*Run Multiple Tasks in Batch***Description**

Executes multiple research tasks, optionally in parallel.

Usage

```

run_task_batch(
  prompts,
  output_format = "text",
  temporal = NULL,
  agent = NULL,
  parallel = FALSE,
  workers = 4L,
  progress = TRUE
)

```

Arguments

prompts	Character vector of task prompts, or a data frame with a 'prompt' column
output_format	Expected output format (applies to all tasks)
temporal	Named list for temporal filtering (applies to all tasks). See run_task for details.
agent	An asa_agent object
parallel	Use parallel processing
workers	Number of parallel workers
progress	Show progress messages

Value

A list of `asa_result` objects, or if `prompts` was a data frame, the data frame with result columns added

See Also

[run_task](#), [configure_temporal](#)

Examples

```
## Not run:
prompts <- c(
  "What is the population of Tokyo?",
  "What is the population of New York?",
  "What is the population of London?"
)
results <- run_task_batch(prompts, agent = agent)

# With temporal filtering for all tasks
results <- run_task_batch(
  prompts,
  temporal = list(time_filter = "y"),
  agent = agent
)

## End(Not run)
```

`safe_json_parse`*Safe JSON Parse*

Description

Attempts to parse JSON, returning NULL on failure.

Usage

```
safe_json_parse(x)
```

Arguments

`x` JSON string

Value

Parsed R object or NULL

search_options	Create Search Options
----------------	-----------------------

Description

Creates search configuration for controlling DuckDuckGo search behavior, including rate limiting, retry policies, and result limits. These options are used by the 4-tier search fallback system.

Usage

```
search_options(
    max_results = NULL,
    timeout = NULL,
    max_retries = NULL,
    retry_delay = NULL,
    backoff_multiplier = NULL,
    inter_search_delay = NULL
)
```

Arguments

max_results	Maximum number of search results to return per query. Higher values provide more context but increase latency. Default: 10.
timeout	Timeout in seconds for individual search requests. Applies to each tier attempt separately. Default: 15.
max_retries	Maximum number of retry attempts when a search tier fails. After exhausting retries, the system falls back to the next tier. Default: 3.
retry_delay	Initial delay in seconds before the first retry. Subsequent retries use exponential backoff. Default: 2.
backoff_multiplier	Multiplier for exponential backoff between retries. E.g., with retry_delay=2 and multiplier=1.5, delays are 2s, 3s, 4.5s. Default: 1.5.
inter_search_delay	Minimum delay in seconds between consecutive searches. Helps avoid rate limiting from search providers. Default: 0.5.

Details

The search system uses a 4-tier fallback architecture:

1. **PRIMP**: HTTP/2 with browser TLS fingerprint
2. **Selenium**: Headless browser for JS-rendered content
3. **DDGS**: Standard ddgs Python library
4. **Requests**: Raw POST to DuckDuckGo HTML endpoint

The retry/backoff settings apply within each tier. If all retries are exhausted, the system automatically falls back to the next tier.

Value

An object of class `asa_search`

See Also

[asa_config](#), [configure_search](#)

Examples

```
## Not run:
# Default settings
search <- search_options()

# More aggressive settings for faster searches
search <- search_options(
  max_results = 5,
  timeout = 10,
  max_retries = 2
)

# Conservative settings for rate-limited environments
search <- search_options(
  inter_search_delay = 2.0,
  max_retries = 5,
  backoff_multiplier = 2.0
)

# Use with asa_config
config <- asa_config(
  backend = "openai",
  search = search_options(max_results = 15)
)

## End(Not run)
```

summary.asa_agent

Summary Method for asa_agent Objects

Description

Summary Method for asa_agent Objects

Usage

```
## S3 method for class 'asa_agent'
summary(object, ...)
```

Arguments

object	An asa_agent object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

`summary.asa_audit_result`*Summary Method for asa_audit_result Objects*

Description

Summary Method for asa_audit_result Objects

Usage

```
## S3 method for class 'asa_audit_result'  
summary(object, ...)
```

Arguments

<code>object</code>	An asa_audit_result object
<code>...</code>	Additional arguments (ignored)

Value

Invisibly returns a summary list

`summary.asa_enumerate_result`*Summary Method for asa_enumerate_result Objects*

Description

Usage

```
## S3 method for class 'asa_enumerate_result'  
summary(object, ...)
```

Arguments

<code>object</code>	An asa_enumerate_result object
<code>...</code>	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_response	<i>Summary Method for asa_response Objects</i>
----------------------	--

Description

Summary Method for asa_response Objects

Usage

```
## S3 method for class 'asa_response'  
summary(object, show_trace = FALSE, ...)
```

Arguments

object	An asa_response object
show_trace	Include full trace in output
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_result	<i>Summary Method for asa_result Objects</i>
--------------------	--

Description

Summary Method for asa_result Objects

Usage

```
## S3 method for class 'asa_result'  
summary(object, ...)
```

Arguments

object	An asa_result object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

temporal_options	Create Temporal Filtering Options
------------------	-----------------------------------

Description

Creates a temporal filtering configuration for constraining search results by date. Supports DuckDuckGo time filters, date ranges, and strict verification modes.

Usage

```
temporal_options(  
  time_filter = NULL,  
  after = NULL,  
  before = NULL,  
  strictness = "best_effort",  
  use_wayback = FALSE  
)
```

Arguments

time_filter	DuckDuckGo time filter: "d" (day), "w" (week), "m" (month), "y" (year), or NULL for no filter
after	ISO 8601 date string (e.g., "2020-01-01") - results after this date
before	ISO 8601 date string (e.g., "2024-01-01") - results before this date
strictness	Verification level: "best_effort" (default) or "strict"
use_wayback	Use Wayback Machine for strict pre-date guarantees

Details

Temporal filtering can operate at different levels:

- **time_filter**: DuckDuckGo native filter (fast, approximate)
- **after/before**: Date hints appended to prompts
- **strict**: Post-hoc verification of result dates
- **use_wayback**: Uses Internet Archive for guaranteed historical data

Value

An object of class `asa_temporal`

See Also

[asa_config](#), [run_task](#)

Examples

```
## Not run:
# Past year only
temporal <- temporal_options(time_filter = "y")

# Specific date range
temporal <- temporal_options(
  after = "2020-01-01",
  before = "2024-01-01"
)

# Strict historical verification
temporal <- temporal_options(
  before = "2015-01-01",
  strictness = "strict",
  use_wayback = TRUE
)

## End(Not run)
```

truncate_string	<i>Truncate String</i>
-----------------	------------------------

Description

Truncates a string to a maximum length, adding ellipsis if truncated.

Usage

```
truncate_string(x, max_length = 100, ellipsis = "...")
```

Arguments

x	Character string
max_length	Maximum length
ellipsis	String to append when truncated

Value

Truncated string

`write_csv.asa_enumerate_result`*Write asa_enumerate_result to CSV*

Description

Write asa_enumerate_result to CSV

Usage

```
write_csv.asa_enumerate_result(x, file, include_provenance = FALSE, ...)
```

Arguments

<code>x</code>	An asa_enumerate_result object
<code>file</code>	Path to output CSV file
<code>include_provenance</code>	Include provenance as additional columns
<code>...</code>	Additional arguments passed to write.csv

Value

Invisibly returns the file path
